Double Patenting

The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

Claims 1-9 are provisionally rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 1-9 of copending Application No. 09/752,984. Although the conflicting claims are not identical, they are not patentably distinct from each other because a transparent window is suitable for transmission measurements. It would have been obvious at the time the invention was made to a person having ordinary skill in the art to use a transparent window for transmission measurements because a transparent window transmits light that can be measured.

This is a <u>provisional</u> obviousness-type double patenting rejection because the conflicting claims have not in fact been patented.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the

Serial Number: 09/753,197 Paper #10, Page 3

basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless --

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-4 are rejected under 35 U.S.C. § 102(b) as being anticipated by Japan KOKAI 11-352,411 to Berndt (" '411" hereinafter). '411, [published 12/24/1999, and which is the Japanese translation of US Application #09/085,689, which Examiner uses as a faithful and definitive translation of '411], discloses:

- an apparatus for hematologic evaluation of individual blood cells arranged in a monolayer which avoids morphology changes in a liquid, the apparatus comprising:
 - (a) a container (see figures) for suspending particles in a liquid, said container having at least one transparent window (1,2);
 - (b) a means for illuminating the suspension with a wavelength of light (inherent in the disclosure of "microscopic analysis" which requires illumination with at least a wavelength of light, and in the disclosure of "spectroscopic investigations"),
 - (c) a means for measuring the intensity of light that reemerges from said suspension (inherent in the disclosure of "microscopic analysis" which requires illumination with at least a wavelength of light, and in the disclosure of "spectroscopic investigations"); and
 - (d) a means for changing the thickness of said container by a known amount (see figure 3, wherein the thickness of the container has been changed a known amount, as determined by laser deflection; since the curvature of the deflection has been measured by laser deflection for one sample and one container, the change in the thickness will be known within a very close range in all future deflections).

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

U. S. Patent #5,427,959, U. S. Patent #6,235,536, U. S. Patent #4,790,640, U. S. Patent #5,948,686, WO 9945365 A1, and WO 9945385 A1 are cited for showing a cuvette which uses variable thicknesses for volumetric analysis of blood.

U. S. Patent #5,715,082 is cited for showing a plunger fixed to a microscope for marking slides.

Allowable Subject Matter

Claims 6-9 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

The following is a statement of reasons for the indication of allowable subject matter: The prior art fails to teach or suggest the plunger fixed with respect to the microscope which comes into contact with the container to change the thickness of the container by a known amount, in the context of the remainder of the claim recitations. Plungers, however, are also known as mechanical elements for the translation of the stage or the microscope objective. What is obvious from '411 is to change the thickness of the container before bringing it close to the objective of the microscope, i.e. to deform it before putting it in the microscope, since the cover stays in place once it is deformed. A plunger might be used to do this. In fact, it would be difficult to envision deforming the cover plate of '411 without a plunger (i.e. by using an air or water jet?) as broadly recited. The invention of fixing the plunger to the microscope to change the thickness of the container is simply not suggested by the '411 disclosure, and this arrangement represents a non-obvious improvement in the useful arts.
